M673F Power Unit Kit Installation Instructions

## M673F installation instructions

Warning:
-Top of battery needs to be protected. If positive side of battery is accidentally
grounded person could be burnt or wiring system can be damaged, or battery gasses
could explode causing injuries.
-Disconnect cable from negative battery terminal before start installation.
-Always wear eye protection and protective clothing when working around hydraulic
systems.
-Remove jewelry and objects that might conduct electricity while working on power
units.
-Fluid under pressure can pierce the skin and enter the bloodstream causing death or serious injury.
5 5
- Hydraulic hoses and electrical cables (harnesses) must be tied and routed safely to
avoid any damage and pinching (away from hot places, sharp objects etc.).

-Do not use teflon tape on hydraulic fittings as it can easily jam valves and plug the filters in the system

-All electrical connections must be greased with die electrical grease to prevent corrosion

- 1. Install power unit (1) to lift frame with motor toward curb side of truck.
- 2. Install colour co-ordinated weather covers on cable and plug assembly (2). Attach red lead to positive motor stud and black lead to the ground motor stud. Liberally coat connections with di-electric grease then slide covers (12)(15) over the eyes on the end of the cables.
- 3. Mount solenoid (3) to metal surface in engine compartment bending bracket if necessary. Be sure to locate the solenoid so that there is sufficient cable to reach to both the battery cable (5) and the cable and plug assembly (2) on the power unit. NOTE: Solenoid must be well grounded in order to function properly.
- 4. Slide weather cover (9) over power (5) and ground (6) cables and route through grille of truck leaving sufficient length to attach to the cable and plug assembly (2). Secure the red power cable (5) to the large terminal on the solenoid and the black ground cable (6) to the negative terminal on the battery.
- 5. Secure power cable (7) from other large terminal on solenoid to positive terminal on battery.
- 6. Plug intermediate harness (8) into power unit harness and follow battery cable routing toward firewall. Locate a pass through hole in the firewall near the driver's side of the truck. Route other end of intermediate harness (8) through the hole in firewall and attach control station.

NOTE: A smaller hole in the firewall can be used if the cable is fed into the engine compartment from the cab as the plug at the power unit end is smaller than at the control station end.

- 7. Attach white wire to ground, black wire to positive side of solenoid and brown wire to small terminal on top of the solenoid.
- 8. Neatly secure all excess cables and wires using tie straps. Silicone hole in firewall.

Note: Be sure all cables are properly protected from any sharp edges or hot or moving parts.

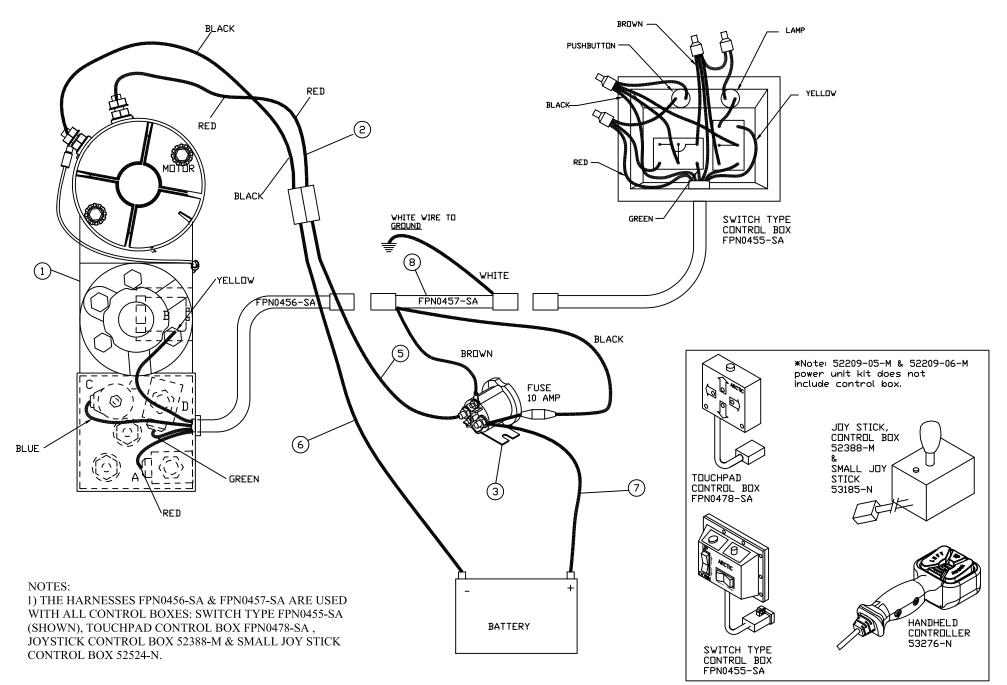

- 9. Install swivel end of 29" hose into port C1. Install 90 degree swivel elbow (10) in curbside (CS) angle cylinder @ 1:00. Connect straight end of 29" hose loosely to swivel elbow.
- Install 90 degree swivel elbow (10) into driver's side (DS) angle cylinder @ 10:00.
  Connect straight end of 18" hose loosely to 90 degree swivel elbow on cylinder. Connect 90 degree swivel end of 29"hose into port C2.
- 11. Remove power unit filler plug and fill reservoir with **UNIVIS J13 (HVI 13)** hydraulic oil. <u>Do not use automatic transmission fluid</u> in this system as it may lead to aeration of the oil in very cold weather conditions. Use of fluid other than J13 will void warranty
- 12. Manually angle the plow to one side before activating the power unit. This can be easily accomplished as the hose connections are loose at the angling cylinders.
- 13. Remove the bleeder hole plug (31). Jog the lift switch until no air is seen in the fluid passing through the bleeder hole. Reinstall and tighten the bleeder plug.
- 14. Jog the angle switch in the direction of the retracted cylinder until no air is seen in the fluid passing through the loose connection. Tighten fittings. Fully extend this cylinder.
- 15. Jog the angling switch in the direction of the other cylinder until no air is seen in the fluid passing through the loosened connection. Tighten fittings.
- 16. Refill power unit so that oil level is <sup>3</sup>/<sub>4</sub>" from the top of the reservoir. Clean up any spilled oil and check all functions several times making sure there is not excessive foaming in the reservoir. Compress the lift cylinder and double check the oil level. Check for leaks at all fittings and reinstall filler plug. Filler plug only has to be snug. Do not torque closed.
